ANNEX IV: Syllabus of the Training Program (Tentative)

Category	Title	Subtitle	Contents
Orientation	Orientation	Overview of Earthquake, Tsunami, and Disasters	Introductory lectures for Seismology and Tsunami Groups are given by staff members of IISEE. Basic concepts and general scope of seismology, earthquake phenomena, strong motion study, seismic hazard and risk, and tsunami, etc. are described.
Basic Subjects Related with	Information Technology	Computer	Practices on FORTRAN programming for scientific computing and on UNIX and GMT are given using PC.
Earthquake and Disasters	Earthquake and Related with	Theory of Seismic Waves	Basic expressions for strain and stress relations are induced from the fundamental concept of the property of elasticity. Mathematical background of the theory of elasticity is discussed from the standpoint of specific problems such as equilibrium conditions, strain energy and transmissions of elastic waves. Reflection and refraction of plane waves are explained. P and S waves velocity distribution is discussed.
		Surface Waves	Crust and upper mantle structure inferred from surface wave methods is explained.
		Scattering and Attenuation	Stochastic modeling and measurement of small-scale heterogeneities and intrinsic attenuation of seismic waves in the crust are explained.
	Earthquake Phenomenology	Earthquake Observation (1), (2)	Basic theory of seismometers is explained. A method for calibration of conventional type of short period seismometer is presented with a practical training. Data acquisition and seismic telemetry systems are explained.
		Local Earthquake Analyses (1)	Analyses of seismograms obtained by local networks, e.g., Wadati diagram, particle motion, apparent velocity, hypocenter determination, and magnitude.
		Local Earthquake Analyses (2)	Practical analyses of seismograms obtained by local network, e.g.,Earthquake location for a homogeneous medium, location errors, iterative weighting, and application.
		Teleseismic Phases and Magnitudes	Teleseismic phases and typical magnitude scales are explained. The Earth's normal modes and their relations to seismic phases are introduced.
		Earthquake Early Warning	The methodologies of Earthquake Early Warning (EEW) are explained, and then actual operation of the system is discussed. Experience of actual operation of nationwide EEW system by the Japan Meteorological Agency is also given.
		Seismicity and Statistics	This course aims to give a basic introduction to statistical techniques that are useful in the study of seismicity. Several statistical techniques and models are introduced and discussed alongside the well-known empirical laws. This course also provides hands-on practical sessions using computer software to analyze seismic activity data.
		Crust and Upper Mantle Structure	Crust and upper mantle structure inferred from explosion seismic and surface methods are explained.
		Crustal Deformation	Introductory course of crustal deformation including geodetic survey and continuous measurement with special references to the problems on modeling of earthquake and volcanic events and earthquake forecasting.
	Seminar of Basic S	eismology	Discussion, presentation and practice for the topics of Basic Seismology

S-Group (Seismology Group)

Advanced Subjects	Earthquake	Earthquake Generation	Earthquake dynamics and scaling laws are explained.
Related with	Circumstance	and Forecasting (1)	Earthquake preparation processes and researches on
Earthquake and Disasters		Early I. Constitution	short-term prediction are introduced.
Disasters		Earthquake Generation and Forecasting (2)	Earthquake cycles and long- and intermediate-term prediction are introduced.
		Mathematics for	Basic concepts and technique of applied mathematics
		Seismology	used often in the field of seismology are explained.
			Subjects include linear differential equations, Fourier
			analysis, matrix algebra and vector analysis. Practice
			of applied mathematics is also given.
		Focal Mechanism	Basic knowledge and practice for determination of focal mechanism by P-wave first motion method.
		Moment Tensor Analysis	Basic knowledge and practice for determination of focal mechanism by moment tensor inversion method.
		Earthquake and Plate	The basic concept of plate tectonics is presented.
		Tectonics	Methods to obtain plate motions are described.
		Earthquake Source	The main purpose of this lecture is to provide you with
		Process	basic earthquake source models and conception of
			earthquake source process, showing techniques to
			synthesize seismic waves from the source models and
			to determine the parameters that can describe
	<u>Olympic i i i i i i i i i i i i i i i i i i </u>	Dete Det	earthquake source process.
	Characteristics	Data Processing	Theory and practice of the least squares method used
	of Earthquake Disasters		for seismological analyses and those of Discrete Fourier transform and digital filter are introduced.
		Study Tour of Earthquake	Study tours to institutes which have observational
		Monitoring	networks to monitor earthquakes are conducted.
		Real Time Determination	Real time determination of source parameters (local
		of Source Parameter	event) is introduced.
		Determination of	Broadband moment magnitude (Mwp) is a magnitude
		Broadband Moment	determined by processing of first arriving P-waves, and
		Magnitude	has been adopted by tsunami warning centers. First,
			this magnitude scale is explained in the lecture. Then,
			computer practices to determine this magnitude are provided.
		Effect of Surface	Effects of surface geology on seismic motion (ESG)
		Geology on Seismic	are explained by showing results of ground motion
		Motion (1)	case studies: amplification mechanisms of seismic
			waves, actual examples of site amplifications at sites
			with various site conditions, relations with earthquake
			damage.
		Effect of Surface	Subsurface explorations and strong motion synthetic
		Geology on Seismic Motion (2)	techniques are explained in detail.
		Seismic Tomography	Theory and application of seismic tomography in local,
			regional, and global scales are explained. Practice on
			computer is also given.
		Numerical Simulation of	Basic theory of seismic wave propagation and
		Seismic Wave	numerical methods for solving the elastic equations are
		Propagation	explained. Seismic wave propagation is
			demonstrated by animation made by computer.
			Practice on the numerical simulation is given by using PC.
	Special Topics	Observation Visits	Observation tour to the institutes that have notable activities in the field of Earth Sciences.
		Tsupami and Farthquaka	Basic concept and overview of tsunamis, including
		Tsunami and Earthquake	tsunami generation, propagation and tsunami warning
			and hazard reduction systems.
		Earthquake Geology	Geological subjects related to earthquake prediction,
			hazard assessment and countermeasures.

		Japanese ODA Policy and	Japanese ODA policy and implementation and the
		Development Assistance Related with Disaster	international trend of development assistance related with disaster management activities including poverty
		Management	and gender issues are explained.
		Seminar of Earthquake	Methodology and practice for Project Management
		Disaster Management	Cycle and its facilitation techniques.
		Policy	
	Seminar of App	lied Seismology	Discussion, presentation and practice for the topics of Applied Seismology
Earthquake Hazard	Earthquake	Soil Test and Survey	Geotechnical field investigation and laboratory testing
and Risk	Hazard		methods are discussed in this lecture. An emphasis is
Assessment	Assessment A		placed on providing the information about currently used practical methods.
		Strong Earthquake	General procedures and system of a strong-motion
		Motion Observation	earthquake observation are presented. Participants are
			introduced to the principle of strong-motion $SMAC$, data acquisition systems and
			accelerometers (SMAC), data acquisition systems and data analysis procedures. Application of strong
			earthquake ground motion to seismic-resisting design
			is explained.
		Soil Dynamics	Fundamental properties of soil such as non-linearity
			and constitutive law are reviewed. Dynamic behavior
			of soil deposits and analytical method are explained
			with evaluation of material constants. Liquefaction of
			sand deposits is discussed and countermeasures against liquefaction are introduced.
		Strong Ground Motion	Seismic Hazard Assessment is discussed, that is an
		Study I (Probabilistic	estimation of the likelihood of an earthquake
		Seismic Hazard Analysis)	occurrence and its magnitude in and around the
			location of interest and of the severity of strong ground
			motions expected for a certain return period.
		Strong Ground Motion Study II (Strong Motion	Strong-motion seismology is concerned with high frequency seismic waves from large earthquakes. Its
		Study II (Strong Motion Seismology)	ultimate goal is to predict strong ground motion from
			the basic understanding of fault mechanics and seismic
			wave propagation in the Earth.
	Earthquake	Microtremor Observation	Practice in the field and analysis are introduced for
	Hazard	(1)	microtremor that is one of the useful information to
	Assessment B		evaluate the characteristics of earthquake ground motion.
		Microtremor Observation	Field practice of microtremor array observation
		(2) Simulation of Seismic	Method to estimate the strong ground motion at the
		Ground Motion	engineering bedrock based on the empirical formulas is explained.
		International Seminar for	Observation Visit to Life Safety Learning Center and
		Disaster Management	relevant lectures (with ICHARM)
		Observation Visit for	Observation visit to the institutes related to disaster
		Dissemination for	management.
		Earthquake Disaster	
		Management	
		Geophysical Prospecting	Principles of seismic refraction and reflection and their applications to the real field are discussed. Field
			applications to the real field are discussed. Field Practice is given.
		Seismic Micro-zonation	This lecture gives an introduction to seismic
		Sector Domation	micro-zoning technique by presenting the methods to
			estimate the distribution of the local and regional
			seismic hazard, explaining the preparation process of
			seismic scenarios, describing the applications of
			micro-zoning results, and discussing the future of
			micro-zoning. Various examples of actual studies are
		IV-3	also presented.

	Seminar of Earth Management	quake Disaster	Methodology and practice for Project Management Cycle and its facilitation techniques.
Case Studies	Practice for Earthquake	Study trips	Study trip to north-eastern part of Japan (Tohoku) for a week and to western part of Japan (Kansai) for a week.
	Disaster – Recovery Management Policy I, II & III	Practice for the topics of Earthquake Disaster Management	Three colloquiums are planned: 1) for the report on the seismic observation and its results in the countries of each participant, 2) for the practice of reading scientific papers, and 3) for explaining the plan of individual study.
Individual Study	Individual Study		During individual study period, each participant makes a research on a specific subject and writes a paper under the direction of an instructor. The subject is selected in the list shown in ANNEX I.
Disaster Management Policy (for Master Program)	Disaster Management Policies A: from Regional and Infrastructure Aspect Disaster Management Policies B: from Urban and Community Aspect		This lecture deals with the various aspects of disaster management policies from the viewpoint of nation-wide or wide range regional and Infrastructure development. The lecture consists of five parts: 1) bird-view lectures to look over the philosophies and principles of disaster management policies, 2) field-wise specialized lectures on practical measures against natural disasters, 3) two special lectures by Japan-representing outstanding lecturers, 4) an one day site-visiting in central Tokyo, and 5) presentations of student groups and overall discussions.
			This lecture aims to provide a broad understanding of disaster risk management policies related to urban, housing and building aspects. It emphasizes application of appropriate and practical measures, reflecting social, economic and environmental conditions of each country.

<u>E- Group (Earthquake Engineering Group)</u>

Category	Title	Subtitle	Contents
Orientation	Orientation	Introduction to Earthquake Engineering	Basic concepts and damage aspects by past earthquakes in Japan are presented as an introductory lecture for engineering course.
		Introduction to Seismology	Seismology for earthquake engineers is introduced focusing on the feature of strong ground motion and its generation, propagation and amplification process.
		Computer	The lecture introduces the computer environment at Building Research Institute (BRI) and International Institute of Seismology and Earthquake Engineering (IISEE). Usage and instructions of the provided laptop PC and the preinstalled software are also given in the lecture.
Basic Subjects Related with Earthquake and Disasters	Structural Analysis	Structural Analysis	Fundamental concepts and principles which are utilized in the current structural analysis are introduced in the matrix algebra language. The displacement method and the force method with some extension to the finite element method and the elastic-plastic analysis of structures are discussed in some detail. Also, fundamental theories for non-linear analyses of building structures are introduced. Some member models and basic concepts of the direct stiffness method are discussed. These theories are also learned with some exercises using available software in IISEE.

	Finite Element Method I	The lecture covers 1) Basic concepts of finite element
		method, 2) Procedures for static linear analysis, 3) Formulation of some elements' matrices and 4)
	Finite Element Method II	Example programs. The lecture covers 1) Aims and Material Modeling, 2) Cracks width analysis and 3) Dynamic Analyses of RC Frames.
	Limit Analysis	Fundamentals of limit analysis (plastic analysis) as well as plastic design of structures are presented. Basic theorems in the limit analysis, safe and unsafe theorems, are introduced, and how to use them when computing the load carrying capacity of a framed structure is illustrated.
	Soil Mechanics	This lecture covers an introduction to fundamental soil mechanics which gives the basis for understanding dynamic behaviors of soil and foundation.
Seminar of St	ructure Analysis	Discussion, presentation and practice for the topic of Structural Analysis
Ground Vibration and Structural Dynamics	Structural Dynamics Structural Response Analysis	The objective of this subject is to study the behavior of structures by dynamic loadings. The lecture covers the SDOF (single-degree-of-freedom) system to the MDOF (multi-degree-of-freedom) linear elastic system. The deterministic procedure is discussed in detail with exercises. Furthermore, the lecture introduces computer programming and provides some practices in programming of typical structural dynamic calculations. Participants compute dynamic response of a Single-Degree-Of-Freedom system and response spectra using Fortran 95. Fourier spectrum analysis is also introduced in the lecture. Inelastic earthquake response analyses are explained using SDOF systems with various kind of hysteresis models and some applications of inelastic earthquake response analyses are introduced. Also, member models and structural idealization which
		are utilized in the current nonlinear structural analysis of buildings are outlined. Examples of dynamic and nonlinear analysis of reinforced concrete structures are presented. Methods for the theoretical interpretation on the results from the numerical analysis are introduced.
	Shaking Table Testing	General concept of structural dynamic test is introduced. Simple shaking table test and free vibration test are practically performed using a small single mass model. Data processing technique is also discussed through the practice.
	Soil Test and Survey II	Some common methods on the field survey of soil deposits and laboratory tests are introduced.
	Effect of Surface Geology on Seismic Motion	Effects of surface geology on seismic motion (ESG) are explained by showing results of ground motion case studies: amplification mechanisms of seismic waves, actual examples of site amplifications at sites with various site conditions, relations with earthquake damage.

		Dynamic Soil Structure Interaction Microtremor Observation I	In case a structure is founded on soft site, its structural behavior is strongly affected by underlying soil with each other. This phenomenon is called "Dynamic Soil-Structure-Interaction (SSI)", and is recognized as being very important for the earthquake resistance design of structure. The physical meaning of the SSI and the influence of SSI on dynamic behaviors of structure are explained. Practice in the field and analysis are introduced for microtremor that is one of the useful information to evaluate the characteristics of earthquake ground motion.
		Microtremor Observation II	Among many techniques for investigating subsurface shear wave velocity structure, microtremor (or ambient vibration) observation is efficient and cost-effective approach for exploration of soils and sediments. In this lecture, basics of microtremor observation techniques and data processing procedures are introduced. Field exercises on single and multiple observations are conducted.
	Seminar of Gro Structural Dyna	ound Vibration and amics	Discussion, presentation and practice for the topic of Ground Vibration and Structural Dynamics
Advanced Subjects Related with Earthquake and Disasters	Seismic Structures	RC Structures I	The structural performance from cracks to collapse about the RC members is predicted by using some equations. The prediction is made by the equations for designs.
		RC Structures II	Detailed structural design procedure of reinforced concrete members for flexure, shear and bond is lectured. Design practice of RC members according to the presented design procedure is conducted.
		RC Structures III	Design of Box-Shaped Wall building and evaluation of seismic performance of RC wall buildings are lectured.
		RC Structures IV	Outline of the seismic design procedure in accordance with the Japanese codes is presented. The related codes in U.S. and New Zealand and the design guidelines currently proposed in Japan are also introduced.
		Steel Structures	Outline of the design procedure for steel building structures in Japan is explained.
		PC Structures	General principles of prestressed concrete and several examples of precast prestressed concrete buildings are introduced. Performance of precast prestressed concrete buildings during recent earthquakes is summarized with current seismic design procedure of prestressed concrete buildings in Japan. Prestressing methods, and calculation of cracking moment and flexural strength of a beam section are lectured with employing a computer program. New seismic design methods being discussed, for example performance-based design, are also introduced with some design examples.
		Masonry Structures I	The lecture presents structural performance and seismic design of Confined Masonry structures, which has been researched in BRI. The lecture also discusses housing construction conditions in the Third World Countries comparing with those of Japan.

Γ			
		Masonry Structures II	First, the concept and the method of seismic design of
			masonry structures are reviewed for several
			representative design codes in the world. Also, the "AIJ
			(Architectural Institute of Japan) Standard for the
			structural design of reinforced concrete hollow concrete
			block masonry structures" is introduced as part of the
			Japanese codes. Second, the seismic behavior of
			masonry buildings is explained from the aspects of
			"seismic evaluation of existing masonry buildings" and
			the "modeling of restoring force characteristics of
			masonry wall members".
		Foundation Engineering	Design concept and design procedures for static and
			earthquake loads for several types of foundation i.e.
			pile, spread and caisson foundations are presented.
			Furthermore, their characteristics, construction
			methods, selection procedures, repairing methods, etc.
			are explained.
		Underground Structures	The lecture covers 1) Buried structures and soil
		and Large Soil	deformations in earthquakes, 2) Key parameters
		Deformations	governing performances of buried structures in
			earthquakes, 3) Earthquake resistant design of buried
			structures and future problems and 4) Other topics.
		Bridge Engineering	Overall view of steel and concrete bridges and
			historical development are presented. Essential
			engineering issues for steel and concrete bridges are
			explained.
		Dam Structures	The types of dams including concrete arch, gravity, and
			embankment dams are explained first. Next, design
			concepts of each type are given. The design of dams to
			resist earthquakes is discussed with the performance of
			dams during earthquakes, dynamic properties of dam
			materials, and analysis. Particularly, behaviors of dams
			during the 1995 Hyogoken-Nanbu Earthquake (Kobe
			Earthquake) and the 2000 Western Tottori Prefecture
			Earthquake are explained.
		Port & Harbor Structures	Earthquake resistant design for port and harbor
		and Tsunami Engineering	structures is explained with some examples of actual
			earthquake damage.
		Structural Testing	Objectives, testing techniques, loading and measuring
			techniques are presented with some examples of the
			previous tests. Static tests for RC members are also
			conducted to observe structural performance.
	Seminar of Seisi	nic Structures	Discussion, presentation and practice for the topic of
			Seismic Structures
	Seismic	Seismic Design Codes	Participants investigate the design concept and methods
	Evaluation and		of the selected seismic codes in the world. Presentation
	Seismic		and discussion are given for comparison of the
	Design Code		surveyed codes. Differences in each code are discussed.
			Also, recent advanced concepts of seismic design codes
			are introduced.
		Design Earthquake	Seismic design code of Japan is introduced. Some
		Ground Motion and	international seismic design codes are also introduced
		Seismic Force	and compared with each other.
		Simulation of Seismic	Methodology of how to generate design earthquake
		Ground Motion	ground motion for engineering purpose is explained. In
			general, the earthquake load is considered as design
			seismic force. However, some buildings for special
			purposes are required to examine structural safety using
1			design ground motions in time domain. A conventional
			methodology used for actual seismic design works is introduced.

		Seismic Micro-Zonation	This lecture introduces to seismic micro zoning
		Seisinic where-Zonation	This lecture introduces to seismic micro-zoning technique by presenting the methods to estimate the
			distribution of the local and regional seismic hazard,
			explaining the preparation process of seismic scenarios,
			describing the applications of micro-zoning results, and
			discussing the future of micro-zoning. Various
			examples of actual studies are also presented.
		Dynamic Aseismic	Dynamic aseismic design procedure is introduced.
		Design	Problems which frequently occur during the design of
		Design	nuclear power plants and high-rise buildings are
			presented with some examples.
		Seismic Isolation	Seismic isolation system is explained as one of
			structural response control methods. The Seismic
			isolation system is most effective to reduce the
			response and improve safety of a superstructure.
			Principles of the seismic isolation, merits and demerits
			of the seismic isolation, and behaviors of buildings
			with the seismically isolated buildings during
			earthquake are discussed.
		Structural Response	Basic theory on structural seismic response control and
		Control	its practical applications in Japan are presented.
		Seismic Design and	This lecture introduces concepts of seismic design
		Retrofit of Bridges	method of highway bridges in Japan. The lecture starts
			from lessons learned from damage experiences in the
			past extreme earthquakes. Outline and concept of
			seismic design specifications of highway bridges in
			Japan are followed. Seismic assessment and retrofit
			design of existing bridges are presented.
	Seminar of Seisi	mic Evaluation and	Discussion, presentation and practice for the topic of
	Seismic Design	Code	Seismic Evaluation and Seismic Design Code

Soil test helps to determine physical characteristics in order to design foundations for structures. Outline of Geotechnical investigation method is introduced in this lecture. Strong motion observation plays important role in the fields of earthquake engineering and building engineering. This lecture explains history and the current situation of the strong motion observation in Japan. The strong motion network of Building Research Institute and the recent research works are also introduced. Moreover, the application of the research results using strong motion data for the seismic design and the earthquake disaster mitigation are described. Fundamental properties of soil such as non-linearity and constitutive law are reviewed. Dynamic behavior of soil deposits and analytical method are explained with evaluation of material constants. Seismic hazard assessment is discussed, that is an estimation of the likelihood of an earthquake occurrence and its magnitude in and around the location of interest and of the severity of strong ground motions expected for a certain return period. Strong-motion seismology is concerned with high frequency seismic waves from large earthquakes. Its

	Seminar of Earth	quake Hazard Assessment	Discussion, presentation and practice for the topic of Earthquake Hazard Assessment
		Structural Reliability	The lecture covers 1) Introduction to reliability concept, 2) Probability of failure as a measure for the safety degree, 3) Extreme value distributions as probability model for load intensity, 4) Load and resistance factor format based on the second moment reliability and 5) Target safety degree due to the optimum reliability.
		System Identification in Vibration Analysis	This subject introduces several system identification methods to determine structural characteristics such as natural periods and damping ratios from measuring data of buildings.
		Seismic Evaluation and Rehabilitation	Seismic capacity evaluation and seismic rehabilitation (retrofit) of existing buildings are introduced with emphasis on our practice after the 1995 Hyogoken-Nanbu Earthquake (Kobe Earthquake).
		Urban Earthquake Disaster Mitigation System	Mechanism and various impacts of earthquake damage in urban areas are analyzed considering the problems generated by urbanization of the area. Based upon the analysis above, issues for establishing proper countermeasures for disaster mitigation are discussed.
		Post-Earthquake Quick Inspection, Damage Evaluation and Rehabilitation	Post-earthquake quick inspection for risk evaluation of secondary disasters is introduced with basic concept of evaluation methods in Japan, U.S. and Europe, and detail procedure and criteria of Japanese method including application example in Turkey. Post-earthquake damage evaluation for decision of rehabilitation strategy, and rehabilitation technique examples for damaged buildings are also introduced.
		Seminar of International Disaster Prevention	Joint & observation visits are planned for JICA course participants of IISEE and ICHARM.
	Seminar of Earth	quake Risk Assessment	Discussion, presentation and practice for the topic of Earthquake Risk Assessment
Special Topics	Tsunami Shelter		The lecture covers 1) Observed Buildings Damage Pattern by Tsunami in Great East Japan Earthquake, 2) Introduction of Design Tsunami Loads in Past Guidelines and New Design Guideline, and 3) A Study on Design Flow and an Example of Tsunami Shelters.
		Policy and Development ed with Disaster	Japanese ODA policy and implementation and the international trend of development assistance related with disaster management activities including poverty and gender issues are explained.
	Seminar of Earth Management Po		Methodology and practice for Project Management Cycle and its facilitation techniques.
Case Study	Practice for Earthquake Disaster – Recovery Management Policy I, II & III	Colloquium Study Trips	Three colloquiums are planned: 1) for seismic codes and past seismic damage of buildings in the countries of each participant, 2) for the practice of reading scientific papers, and 3) for explaining the plan of individual study. Study trip to northern part of Japan (Tohoku) for a
		inar of Earthquake	week and to western part of Japan (Kansai) for a week. Practice for the topics of Earthquake Disaster
Individual Study	Disaster Manage Individual Study		ManagementDuring individual study period, each participant makes a research on a specific subject and writes a paper under the direction of an instructor. The subject is selected in the list shown in ANNEX I.
Disaster Management Policy		ment Policies A: from frastructure Aspect	This lecture deals with the various aspects of disaster management policies from the viewpoint of nation-wide or wide range regional and Infrastructure

(for Master		development. The lecture consists of five parts: 1)
Program)		bird-view lectures to look over the philosophies and
		principles of disaster management policies, 2)
		field-wise specialized lectures on practical measures
		against natural disasters, 3) two special lectures by
		Japan-representing outstanding lecturers, 4) an one day
		site-visiting in central Tokyo, and 5) presentations of
		student groups and overall discussions.
	Disaster Management Policies B: from	This lecture aims to provide a broad understanding of
	Urban and Community Aspect	disaster risk management policies related to urban,
		housing and building aspects. It emphasizes application
		of appropriate and practical measures, reflecting social,
		economic and environmental conditions of each
		country.

T- Group (Tsunami Group)

Category	Title	Subtitle	Contents
Orientation	Orientation	Overview of Earthquake, Tsunami, and Disasters	Introductory lectures for Seismology and Tsunami Groups are given by staff members of IISEE. Basic concepts and general scope of seismology, earthquake phenomena, strong motion study, seismic hazard and risk, and tsunami, etc. are described.
		Tsunami and Earthquakes	Basic concept and overview of tsunamis, including tsunami generation, propagation and tsunami warning and hazard reduction systems.
BasicSubjectsRelatedwith	Information Technology	Computer	Practices on FORTRAN programming for scientific computing and on UNIX and GMT are given using PC.
Earthquake and Disasters	Earthquake and Related with	Theory of Seismic Waves	Basic expressions for strain and stress relations are induced from the fundamental concept of the property of elasticity. Mathematical background of the theory of elasticity is discussed from the standpoint of specific problems such as equilibrium conditions, strain energy and transmissions of elastic waves. Reflection and refraction of plane waves are explained. P and S waves velocity distribution is discussed.
		Surface Waves	Crust and upper mantle structure inferred from surface wave methods is explained.
	Earthquake Phenomenolog y	Earthquake Observation (1), (2)	Basic theory of electro-magnetic seismometer is explained. A method for calibration of conventional type of short period seismometer is presented. Practical training for the calibration is also planned. Data acquisition and seismic telemetry systems are explained.
		Local Earthquake Analyses (1)	Analyses of seismograms obtained by local networks, e. g., Wadati diagram, particle motion, apparent velocity, hypocenter determination, and magnitude.
		Local Earthquake Analyses (2)	Practical analyses of seismograms obtained by local network, e.g., Earthquake location for a homogeneous medium, location errors, iterative weighting, and application.
		Teleseismic Phases and Magnitudes	Teleseismic phases and typical magnitude scales are explained. The Earth's normal modes and their relations to seismic phases are introduced.
		Observation of Seismological Observatory	Observation of Matsushiro Seismological Observatory, Japan Meteorological Agency.

		Earthquake Early Warning	The methodologies of Earthquake Early Warning (EEW) are explained, and then actual operation of the system is discussed. Experience of actual operation of
		Seismicity and Statistics	nationwide EEW system by the Japan Meteorological Agency is also given. This course aims to give a basic introduction to
			statistical techniques that are useful in the study of seismicity. Several statistical techniques and models are introduced and discussed alongside the well-known empirical laws. This course also provides hands-on practical sessions using computer software to analyze seismic activity data.
		Crust and Upper Mantle Structure	Crust and upper mantle structure inferred from explosion seismic and surface methods are explained.
		Crustal Deformation	Introductory course of crustal deformation including geodetic survey and continuous measurement with special references to the problems on modeling of earthquake and volcanic events and earthquake forecasting.
	Seminar of Basic Seismology		Discussion, presentation and practice for the topics of Basic Seismology
Advanced Subjects Related with Earthquake	Earthquake Circumstance	Earthquake Generation and Forecasting (1)	Earthquake dynamics and scaling laws are explained. Earthquake preparation processes and researches on short-term prediction are introduced.
and Disasters		Earthquake Generation and Forecasting (2) Mathematics for	Earthquake cycles and long- and intermediate-term prediction are introduced. Basic concepts and technique of applied mathematics
		Seismology	used often in the field of seismology are explained. Subjects include linear differential equations, Fourier analysis, matrix algebra and vector analysis. Practice of applied mathematics is also given.
		Focal Mechanism	Basic knowledge and practice for determination of focal mechanism by P-wave first motion method.
		Moment Tensor Analysis	Basic knowledge and practice for determination of focal mechanism by moment tensor inversion method.
		Earthquake and Plate Tectonics	The basic concept of plate tectonics is presented. Methods to obtain plate motions are described.
		Earthquake Source Process	The main purpose of this lecture is to provide you with basic earthquake source models and conception of earthquake source process, showing techniques to synthesize seismic waves from the source models and to determine the parameters that can describe earthquake source process.
	Theory of Tsunami	Tsunami Simulation	Hands-on practices to calculate tsunami waveforms and tsunami height are given by using Linux WS and Windows PC. In order to help the interpretation of simulation results, visualization technique using mapping software are also introduced.
		Data Processing	Theory and practice of the least squares method used for seismological analyses and those of Discrete Fourier transform and digital filter are introduced.
		Practice for Theory of Tsunami	Specific tasks and subjects on Practice for Theory of Tsunami are given considering interests and backgrounds of participants.
		Tsunami Magnitude and Catalogue	History of large tsunamis in the world is explained and discussed. Existing tsunami catalogues are also studied. The size of tsunami is described by various magnitude scales. Mechanisms of tsunami earthquakes are also learned. Various tsunami generated by non-earthquake origins, such as landslides or volcanic activities, are
			also studied.

		Mathematics for Tsunami	Practices on applied mathematics used often in the field
			of tsunami are given.
		Hydrodynamics for Tsunami	The basic equation of fluid dynamics, general ocean wave theory, tsunami generation theory, and non-linear wave theory of tsunamis are explained.
		Tsunami Generation and Propagation	Tsunami generation from earthquake fault motion and tsunami propagation: Both forward and inverse modelings are explained.
		Tsunami Source	To calculate travel time of tsunami some computer practices are given. Basic concept to estimate a tsunami source area from arrival times of observed tsunami is explained. Hands-on practices to estimate tsunami source are also given.
		Geology for Tsunami	Basic techniques for detecting geological and geomorphological evidences of paleo-tsunami and paleo-earthquake are explained. Subjects include coastal sedimentlogy, coastal geomorphology and Quaternary geochronology.
Tsunami Hazard and Risk Assessment	Tsunami Hazard Assessment	Tsunami Hazard Map	Basic concepts and outline of tsunami hazard map, method of making tsunami hazard map, use of tsunami hazard map and tsunami countermeasures in river and coastal zone in Japan are explained.
		Tsunami Disaster Prevention Administration	Tsunami disaster prevention schemes by local government are introduced. We visit Kesen-numa city along the Sanriku coast and learn about governmental approaches for tsunami disaster prevention.
		Lessons from the Great East Japan Earthquake of March 11, 2011	Disaster prevention for millennium earthquakes-tsunamis and characteristics of the 2011 Great East Japan earthquake – tsunami are introduced.
		Tsunami Disaster Mitigation Policy and Risk Management in Japan	A visit to the Cabinet of Japan and the Port and Harbor Bureau to study tsunami disaster mitigation policy and risk management in Japan is conducted.
		Introduction of Tsunami Disaster Mitigation	Various features of tsunamis are explained with hydrodynamic principles. Many kinds of tsunami disasters are shown by examples in the past, and possible disasters in the future are also estimated.
		Tsunami Hazard Assessment	Basics on the tsunami hazards assessment is introduced by reviewing historical and recent tsunami hazard/disaster and providing the idea of the risk analysis. Records of tsunamis in the documentation and geological evidences are examined to estimate the
		Tsunami Damage Survey	frequency. Characteristics of tsunami damages are introduced through examples of post-tsunami survey results. Survey method is explained with the theory. After explanations for matters to be attended in field survey, survey exercise is conducted.
		TheoryofTsunamiPropagationandInundationSimulation	This class aims to understand the logic of source program of TUNAMI-N1 and N2 (Linear and Non-linear model of tsunami propagation and run-up).
		Numerical Simulation of Tsunami Inundation and its Application	A finite difference method for the long-wave model is explained. Simulation exercises for tsunami propagation and inundation are given.
		Tsunami Evacuation Planning and Simulation	Overview of tsunami evacuation planning and tsunami evacuation simulation. Hands on concepts, definitions, steps and issues for tsunami evacuation planning. Review of methodologies used on tsunami evacuation simulation.
		Scenario Earthquakes	You learn a method for setting Scenario earthquakes for tsunami situation.

	Tsunami Countermeasu	Tsunami Protection Facility	A field study, in which the tsunami protection facilities are observed, is included in the course. A field trip to
	res		observe the tsunami trace and to understand the damages due to tsunamis is also conducted along the Sanriku coast.
		Tsunami Damage and Reconstruction I and II	Observation of tsunami damage caused by the Great East Japan earthquake disaster and reconstruction process.
		Tsunami Observation	Sea level observation method and tidal data analysis are introduced. Tidal station tour is also conducted.
		Tsunami Early Warning System and Dissemination	Outline of tsunami warning service and tsunami estimation are explained.
		Practice for Tsunami Countermeasures	Each participant has practices so that he/she can improve understanding on the subject "Tsunami Countermeasures." IISEE staff members decide specific tasks and subjects considering interests and backgrounds of participants.
		Tsunami Force and Tsunami Resistant Structure	Design formulas of tsunami force are introduced and some examples to computation of tsunami force are lectured. An experiment to evaluate the tsunami impulsive force is demonstrated during the course. As tsunami resistant structures, breakwaters and tidal barriers are shown as well as greenbelt techniques.
		Tsunami Deposit Survey	Observation of tsunami damage caused by the Great East Japan earthquake disaster and reconstruction process.
		Tsunami Load and Structural Design of Tsunami Shelter	Observe buildings damage pattern by tsunami in Great East Japan Earthquake. Introduction of design tsunami loads in past guidelines and new design guideline. A study on design flow and an example of Tsunami shelters.
		International Seminar for Disaster Management	Observation Visit to Life Safety Learning Center and relevant lectures (with ICHARM)
	Special Topics	Study Tour of Earthquake Monitoring	Observation tour to the institutes that have notable activities in the field of Earth Sciences.
		Japanese ODA Policy and Development Assistance Related with Disaster Management	Japanese ODA policy and implementation and the international trend of development assistance related with disaster management activities including poverty and gender issues are explained.
		Seminar of Earthquake Disaster Management Policy	Methodology and practice for Project Management Cycle and its facilitation techniques.
Case Studies	Practice for Earthquake Disaster – Recovery Management Policy I & II	First, Second, and Third Colloquiums	Three colloquiums are planned: 1) for the report on the seismic observation and its results in the countries of each participant, 2) for the practice of reading scientific papers, and 3) for explaining the plan of individual study.
	Practice for Tsunami	Real Time Determination of Source Parameter	Real time determination of source parameters (local event) is introduced.
	Disaster Mitigation Policy	Determination of Broadband Moment Magnitude	Broadband moment magnitude (Mwp) is a magnitude determined by processing of first arriving P-waves, and has been adopted by tsunami warning centers. First, this magnitude scale is explained in the lecture. Then, computer practices to determine this magnitude are provided.
	Departies for C	Study Trips	Study trip to northern part of Japan (Tohoku) for a week and to western part of Japan (Kansai) for a week.
	Mitigation Polic	minar of Tsunami Disaster y	Practice for the topics of Tsunami Disaster Mitigation Policy.

Individual Study	Individual Study	During individual study period, each participant makes a research on a specific subject and writes a paper under the direction of an instructor. The subject is selected in the list shown in ANNEX I.
Disaster Management Policy (for Master Program)	Disaster Management Policies A: from Regional and Infrastructure Aspect	This lecture deals with the various aspects of disaster management policies from the viewpoint of nation-wide or wide range regional and Infrastructure development. The lecture consists of five parts: 1) bird-view lectures to look over the philosophies and principles of disaster management policies, 2) field-wise specialized lectures on practical measures against natural disasters, 3) two special lectures by Japan-representing outstanding lecturers, 4) an one day site-visiting in central Tokyo, and 5) presentations of student groups and overall discussions.
	Disaster Management Policies B: from Urban and Community Aspect	This lecture aims to provide a broad understanding of disaster risk management policies related to urban, housing and building aspects. It emphasizes application of appropriate and practical measures, reflecting social, economic and environmental conditions of each country.
